REPORT DISCLAIMER

This audit was conducted in accordance with the standards developed by the American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) for a Level II audit. Cost and savings calculations for a given measure were estimated to within $\pm 20\%$, and are based on data obtained from the owner, data obtained during site observations, professional experience, historical data, and standard engineering practice. Cost data does not include soft costs such as engineering fees, legal fees, project management fees, financing, etc.

A thorough walkthrough of the building was performed, which included gathering nameplate information and operating parameters for all accessible equipment and lighting systems. Unless otherwise stated, model, efficiency, and capacity information included in this report were collected directly from equipment nameplates and /or from documentation provided by the owner during the site visit. Typical operation and scheduling information was obtained from interviewing staff and spot measurements taken in the field.

List of Common Energy Audit Abbreviations

- A/C Air Conditioning
- AHS Air Handling Unit
- BMS Building Management System
- Btu British thermal unit
- CDW Condenser Water
- CFM Cubic feet per minute
- CHW Chilled Water
- DCV Demand Control Ventilation
- DDC Direct Digital Control
- DHW Domestic Hot Water
- DX Direct Expansion
- EER Energy Efficiency Ratio
- EF Exhaust Fan
- EUI Energy Use Intensity
- Gal Gallon
- GPD Gallons per day
- GPF Gallons Per Flush
- GPH Gallons per hour
- GPM Gallons per minute
- GPS Gallons per second
- HHW Heating Hot Water
- HID High Intensity Discharge
- HP Horsepower
- HRU Heat Recovery Unit
- HVAC Heating, Ventilation, Air Conditioning
- HX Heat Exchanger
- kbtu/mbtu One thousand (1,000) Btu
- kW Kilowatt (1,000 watts)
- kWh Kilowatt-hours
- LED Light Emitting Diode
- mbh Thousand Btu per hour
- mmbtu One million (1,000,000) Btu
- OCC Occupancy Sensor
- PSI Pounds per square inch
- RTU Rooftop Unit
- SBC System Benefits Charge
- SF Square foot
- UH Unit Heater
- V Volts
- VAV Variable Air Volume
- VSD Variable Speed Drive
- W-Watt

1.0 EXECUTIVE SUMMARY

This report summarizes the energy audit performed by CHA for Glen Rock Fire Department facility in connection with the New Jersey Board of Public Utilities (NJBPU) Local Government Energy Audit (LGEA) Program. The purpose of this report is to identify energy savings opportunities associated with major energy consumers and inefficient practices. Low-cost and no-cost are also identified during the study. This report details the results of the energy audit conducted for the building listed below:

Building Name	Address	Square Feet	Construction Date
Fire Department	1 Harding Plaza, Glen Rock, NJ 07452	9,604	Early 1900s

The potential total annual energy and cost savings for the recommended energy conservation measures (ECM) identified in the survey are shown below:

Building Name	Electric Savings (kWh)	NG Savings (therms)	Total Savings (\$)	Payback (years)
Fire Department	18,235	546	\$3,619	8.2

Each individual measure's annual savings are dependent on that measure alone, there are no interactive effects calculated. There are three options shown for Lighting ECM savings; only one option can be chosen. Incentives shown (if any) are based only on the SmartStart Incentive Program. Other NJBPU or local utility incentives may also be available/ applicable and are discussed in Section 6.0.

Each measure recommended by CHA typically has a stand-alone simple payback period of 15 years or less. However, if the owner choses to pursue an Energy Savings Improvement Plan (ESIP), high payback measures could be bundled with lower payback measures which ultimately can result in a payback which is favorable for an ESIP project to proceed. Occasionally, we will recommend an ECM that has a longer payback period, based on the need to replace that piece(s) of equipment due to its age, such as a boiler for example.

The following table provides a detailed summary of each ECM for the building surveyed, including costs, savings, SmartStart incentives and payback.

ECM #	Energy Conservation Measure	Est. Costs (\$)	Est. Savings (\$/year)	Payback w/o Incentive	Potential Incentive (\$)*	Payback w/ Incentive	Recommended
1	Install roof/ceiling insulation	44,695	433	103.2	0	103.2	Ν
2	Replace DHW heater with condensing DHW heater	8,511	310	27.5	50	27.3	Y
3	Install pipe insulation	717	279	2.6	0	2.6	Υ
L1	Lighting Replacements / Upgrades	22,089	3,029	7.3	1,478	6.8	Y
	Total**	76,012	4,052	19	1,528	18	
	Total(Recommended)	31,317	3,619	9	1,528	8.2	

Summary of Energy Conservation Measures

* Incentive shown, if available, is per the New Jersey SmartStart Program. ** These ECMs are not included in the Total, as they are alternate measures not recommended.

Due to the fact that there is limited available roof space on this building and the roof is significantly shaded by trees, it was not recommended to install a solar PV system.

If the Borough of Glen Rock implements the recommended ECMs, energy savings would be as follows:

	Existing Conditions	Post Recommended ECMs	Percent Savings
Costs (\$)	18,647	14,461	22%
Electricity (kWh)	69,040	50,805	26%
Natural Gas (therms)	6,295	5,749	9%
Greenhouse Gas Reduction (MT			
CO2)	63	52	17%
Site EUI (kbtu/SF/Yr)	90.1	77.9	

2.0 BUILDING INFORMATION AND EXISTING CONDITIONS

The following is a summary of building information related to HVAC, plumbing, building envelope, lighting, and domestic hot water systems as observed during CHAs site visit. <u>See appendix B for detailed information on mechanical equipment, including capacities, model numbers and age.</u> See appendix F for representative photos of some of the existing conditions observed while onsite.

Building Name: Fire Department Address: 1 Harding Plaza, Glen Rock, NJ 07452 Gross Floor Area: 9,604 sq. ft. Number of Floors: Two floors Year Built: 1930s

General

Description of Spaces: The building is used as an emergency services building for the Glen Rock Fire Department. It has offices, storage rooms, restrooms and four garage bays.

Description of Occupancy: The facility has an estimated 20 part-time employees.

Number of Computers: The building has approximately 5 desktop and laptop computers.

Building Usage: The Fire Department is volunteer, so the building has the potential to be occupied 24/7 year round, but is typically only occupied during emergency events.

Construction: The original three garage bay building located at the right side of the current structure is constructed of multiple layers of brick with some partial ceramic tile interior finish in the garages. Some of the spaces have had concrete masonry block reinforcement. The remaining building is constructed of concrete masonry blocks with brick exterior fascia. Some of the rooms in the building have had stud framed walls installed with sheetrock interior finish. It is assumed that these walls have some insulation while the others have none. The walls are in good condition.

Roof: This facility has a flat roof constructed of concrete decking, rigid tapered insulation and a black EPDM rubber membrane. The roofing system is in fair condition, however it was noted that there is a large parapet wall surrounding the roof structure which would allow for installation of additional tapered rigid insulation. A measure has been included to evaluate installing additional roof insulation.

Windows: The building has double pane windows with wooden framing and exterior storm windows. These windows appear to have been installed as part of a renovation project and are in good condition.

Exterior Doors: The garage has four insulated composite roll up doors. The main entrance door is an insulated steel door with small double pane windows. The doors and their seals and sweeps all appear to be in good condition.

Heating Ventilation & Air Conditioning (HVAC) Systems

Heating & Cooling: One of the garage bays, named the 834 fire rescue bay, is heated by natural gas fired infrared heaters. One of the two infrared heaters that heats this bay is broken and has not been operational for at least a year. Although this unit should be replaced to ensure proper heating of the space, there is unfortunately no energy savings associated with its replacement therefore an ECM was not recommended in this study. The second infrared heater appeared to be in good condition, but it should be considered to replace both heaters at the same time when the failed unit gets replaced.

The remaining garage bays and several of the first floor common areas and side rooms are heated by cabinet unit heaters, wall hung unit heaters and perimeter fin tube radiation. These terminal devices are provided with heating hot water by a brand new natural gas fired Aerco AM Series condensing boiler. Heating hot water from this boiler is circulated to the terminal devices by (1) fractional HP boiler primary pump and (4) fractional horsepower zone pumps. This boiler and hot water pumping system is brand new and in good condition, however, none of the hot water piping was insulated during the system installation. An ECM has been included to evaluate the installation of piping insulation.

The second floor areas are heated and cooled by (2) Trane packaged rooftop air handling units (RTUs) having direct expansion (DX) cooling and natural gas heat. The larger of these units serves the second floor meeting room and was installed this year and manufactured in April of 2015. The smaller unit was manufactured in 2003 and serves the offices on the opposite side of the second floor.

The front office of the building is heated by a through the wall heat pump unit that appears to be in good condition.

Ventilation: Ventilation is provided by the RTUs described above. There is no ECM associated with the ventilation system.

Exhaust: This building has (3) roof mounted exhaust fans. One of these fans serves the kitchen hood and the other two serve the bathrooms. None of the nameplates on these fans had information relating to total fan horsepower, but it is assumed based on the size of the units that they are all (1) HP or smaller fan motors. No ECM has been evaluated for the exhaust fans.

Controls Systems

Space temperature control is achieved using several space mounted programmable thermostats. These thermostats are 7-day programmable. All of the thermostats observed were set at unoccupied temperatures and are scheduled at 65°F heating and 78°F cooling at all times until the building is occupied. When occupants arrive they adjust the temperature to their desired temperatures. These thermostats are in good condition and are programmed well. No ECM has been evaluated with relation to modifying the HVAC control system.

Domestic Hot Water Systems

Domestic hot water to the entire building is provided by a Bradford White natural gas fired water heater installed next to the heating hot water boiler in the ground floor boiler room. This water heater operates at an efficiency of 80% per the manufacturers specifications. The water heater is new and in good condition, however there was no piping insulation installed on the hot water piping and it is not efficient by today's standards. An ECM has been evaluated to replace this water heater with a condensing tank type water heater, as well as a measure to install piping insulation.

Kitchen Equipment

The kitchen equipment in this building includes one large combination range/stove which is natural gas fired and is in good condition. In addition, the kitchen is not used very heavily. No ECM was considered for replacing this equipment.

Plug Load

This building has computers, copiers, residential appliances and general appliances used in the apparatus bays that contribute to the plug load in the building. We have calculated the plug load to have minimal impact compared to other electric consuming devices. A recommendation has been included in the O&M section to purchase Energy Star rated equipment when the old ones need replacement.

Plumbing Systems

There are two restrooms in this facility that have sinks, urinals and toilets are all high water consuming fixtures. The sinks use 2.5 gallons per minute, and the urinals and toilets use 3.5 gallons per flush. Due to the fact that this fire station has only part time occupants, the use of these plumbing fixtures is minimal. Because of the low use, no ECM has been evaluated for replacing plumbing fixtures.

Lighting Systems

The majority of the lighting in this building consists of 4' linear fluorescent fixtures utilizing 32 watt lamps. There are also several incandescent and compact fluorescent fixtures using various wattage and style bulbs. All of the lighting in the building is manually controlled by wall mounted switches. The exterior lighting consists of various wattage metal halide wall pack fixtures. LED lights are recommended in this study. We have provided three alternatives for the observed lighting that include adding occupancy sensors to the existing lights, replacing the lights with LED lights and a third ECM that evaluates adding occupancy sensors to the proposed LED lights.

3.0 UTILITIES

Natural gas and electricity are separately metered into this building. Utilities used by the building are delivered and supplied by the following utility companies:

	Electric	Natural Gas	
Deliverer	PSE&G	PSE&G	
Supplier	Direct Energy	PSE&G	

For the 12-month period ending in June 2014, the utilities usages and costs for the building were as follows:

Electric							
Annual Usage	69,040	kWh/yr					
Annual Cost	11,850	\$					
Blended Rate	0.172	\$/kWh					
Consumption Rate	0.144	\$/kWh					
Demand Rate	7.93	\$/kW					
Peak Demand	30.4	kW					
Min. Demand	12.0	kW					
Avg. Demand	19.8	kW					
Natu	Iral Gas						
Annual Usage	6,295	Therms/yr					
Annual Cost	6,791	\$					
Blended Rate	1.079	\$/therm					

Blended Rate: Average rate charged determined by the annual cost / annual usage Supply Rate: Estimated

Demand Rate: Rate charged for actual electrical demand in kW (based on most recent electric bill)

The electric usage fluctuates with the building usage. The major electricity consuming loads in the building are lighting and air conditioners. The consumption increases in the summer when the cooling equipment is operational and flattens out for the rest of the year when the loads are mostly lighting.

Natural gas in this building is used by the hot water boiler and domestic hot water heater (DHW). The gas usage in non-heating season is small and only for DHW heating. The gas usage during the heating season varies with winter weather conditions.

See Appendix A for utility analysis.

Under New Jersey's energy deregulation law, the supply portion of the electric (or natural gas) bill is separated from the delivery portion. The supply portion is open to competition, and customers can shop around for the best price for their energy suppliers. The electric and natural gas distribution utilities will still deliver the gas/ electric supplies through their wires and pipes – and respond to emergencies, should they arise – regardless of where those supplies are purchased. Purchasing the energy supplies from a company other than your electric or gas utility is purely an economic decision; it has no impact on the reliability or safety of the service.

Comp	Recommended to			
Utility	Units	Average Rate	Shop for Third	
-		-		Party Supplier?
Electricity	\$/kWh	\$0.172	\$0.13	Y
Natural Gas	\$/Therm	\$1.079	\$0.96	Y

* Per U.S. Energy Information Administration (2015 data – Electricity and Natural Gas, 2015 data – Fuel Oil)

Additional information on selecting a third party energy supplier is available here:

http://www.state.nj.us/bpu/commercial/shopping.html.

See Appendix A for a list of third-party energy suppliers licensed by the Board of Public Utilities to sell within the building's service area.

The charts below represent estimated utility end-use utility profiles for the building. The values used within the charts were estimated from a review of the utility analysis and the energy savings calculations.

Site End-Use Utility Profile

4.0 BENCHMARKING

The EPA Portfolio Manager benchmarking tool provides a site and source Energy Use Intensity (EUI), as well as an Energy Star performance rating for qualifying building types. The EUIs are provided in kBtu/ft²/year, and the performance rating represents how energy efficient a building is on a scale of 1 to 100, with 100 being the most efficient. In order for a building to receive and Energy Star label, the energy benchmark rating must be at least 75. As energy use decreases from implementation of the proposed measures, the Energy Star rating will increase. However, the EPA does not have score for all types of buildings. The buildings that do not have energy rating now are compared with national median EUI.

The site EUI is the amount of heat and electricity consumed by a building as reflected in utility bills. Site energy may be delivered to a facility in the form of primary energy, which is raw fuel burned to create heat or electricity, such as natural gas or oil; or as secondary energy, which is the product created from a raw fuel such as electricity or district steam. To provide an equitable comparison for different buildings with varying proportions of primary and secondary energy consumption, Portfolio Manager uses the convention of source EUIs. The source energy also accounts for losses incurred in production, storage, transmission, and delivery of energy to the site, which provide an equivalent measure for various types of buildings with differing energy sources. The results of the benchmarking are contained in the table below.

Site EUI kBtu/ft²/yr	Source EUI (kBtu/ft²/yr)	Energy Star Rating (1-100)
90.1	145.8	NA

The building's Energy Star score is not available as this building is labeled in portfolio managers "other" category and does not closely match a category with enough available supporting benchmarking data. The score is a 1-100 assessment of a building's energy efficiency as compared with similar buildings nationwide. A score of 50 represents median energy performance and a score of 75 or higher indicates that the building is a top performer. The site EUI of the building is 90.1 and source EUI is 145.8. The building has lower EUIs than the national median EUIs (national median site EUI is 95.3 kBtu/ft² and national median source EUI is 154.4 kBtu/ft²). The EUI of this building is (-)6% lower than national median. The EUI could be further reduced after implementing some of the proposed energy conservation measures.

5.0 ENERGY CONSERVATION MEASURES

The following types of energy savings opportunities are identified in this section of the report:

- Energy conservation measures (ECMs) are energy savings recommendations that typically require a financial investment. For these areas of opportunity, CHA prepared detailed calculations, as summarized in this section and in Appendix C. In general, additional savings may exist from reductions in maintenance activities associated with new equipment or better controls; however for conservatism, maintenance savings are not accounted for in this report; instead the only savings which are reported are those derived directly from reductions in energy which can be tracked by the utility bills.
- Operational and Maintenance measures (O&M) consist of low- or no-cost operational opportunities, which if implemented would have positive impacts on overall building operation, comfort levels, and/or energy usage. There are no estimated savings, costs or paybacks associated with the O&M measures included as part of this study.

Energy savings were quantified in the form of:

- electrical usage (kWh=Kilowatt-hour),
- electrical demand (kW=kilowatts),
- natural gas (therms=100,000 Btu),
- propane gas (gallons=91,650 Btu),
- fuel oil (gallons =138,700 Btu), and
- water (kgal=1,000 gallons).

These recommendations are influenced by the time period that it takes for a proposed project to "break even" referred to as "Simple Payback". Simple payback is calculated by dividing the estimated cost of implementing the ECM by the energy cost savings (in dollars) of that ECM.

Another financial indicator of the performance of a particular ECM is the Return on Investment or ROI, which represents the benefit (annual savings over the life of a project) of an investment divided by the cost of the investment. The result is expressed as a percentage or ratio.

Two other financial analyses included in this report are Internal Rate of Return (IRR) and Net Present Value (NPV). Internal Rate of Return is the discount rate at which the present value of a project costs equals the present value of the project savings. Net Present Value is the difference between present value of an investment's future net cash flows and the initial investment. If the NPV equals "0", the project would equate to investing the same amount of dollars at the desired rate. NPV is sometimes referred to as Net Present Worth. These values are provided in the Summary Tab in Appendix C.

5.1 ECM-1: Install Roof Insulation (Incremental Cost)

The existing building has a flat roof with tapered rigid insulation and an EPDM rubber membrane surface. The roof appears to have been replaced when the additional garage bay was constructed. The roof is in fair condition, but appears to be reaching the end of its useful life and is estimated to have an approximate thermal resistance value of R-10. This measure proposes installing additional rigid tapered insulation to the roof when the existing roof gets replaced. The total proposed thermal resistance evaluated in the calculations is R-26. Energy savings in the form of electricity and natural gas will result from a reduction in heating and cooling loads. The implementation costs associated for this measure do not account for the roofing material itself, as it is assumed that the roof will need to be replaced soon as a capital expenditure.

The implementation cost and savings related to this ECM are presented in Appendix C and summarized below:

Budgetary		Annua	l Utility Savings		ROI	Potential	Payback (without	Payback (with
COSI	E	lectricity	Natural Gas	Total		Incentive	incentive)	incentive)
\$	kW	kWh	Therms	\$		\$	Years	Years
44.695	0	120	385	433	(0.9)	0	103.2	103.2

ECM-1 Install roof insulation (incremental cost)

* Incentive shown, if available, is per the New Jersey SmartStart Program. See section 6.0 for other incentive opportunities.

This measure is not recommended due to the long payback period. It is recommended, however, to install additional roof when the borough pursues replacing this roof as there is significant space available for more insulation.

5.2 ECM-2: Replace DHW heater with Condensing DHW heater

The existing domestic hot water heater is a standard efficiency water heater. Although this unit is fairly new, it only operates at a rated efficiency of 80% per the manufacturer. It is recommended to replace this water heater with a condensing type water heater of the same capacity that will operate at an efficiency of 96% or higher. Natural gas savings will result from improved water heating system efficiency.

The implementation cost and savings related to this ECM are presented in Appendix C and summarized below:

-		cpiac			onucitain	g Dinte	icalci		
В	Budgetary		Annua	l Utility Savings		ROI	Potential	Payback (without	Payback (with
	Cost	E	lectricity	Natural Gas	Total		incentive	incentive)	incentive)
	\$	kW	kWh	Therms	\$		\$	Years	Years
	8,511	0	0	287	310	(0.9)	50	27.5	27.3

ECM-2 Replace DHW heater with Condensing DHW heater

* Incentive shown, if available, is per the New Jersey SmartStart Program. See section 6.0 for other incentive opportunities.

This measure is recommended.

5.3 ECM-3: Install pipe insulation

The boiler room contains both a new DHW heater as well as a new boiler. It was noted during the site visit that when these systems were installed, none of the hot water piping in the boiler room was insulated. It is recommended to install piping insulation on all of the hot water piping in this room as well as any other piping found to be un-insulated. Natural gas savings will result from reduced heat transfer and reduced heating loads of the water heater and boiler systems.

The implementation cost and savings related to this ECM are presented in Appendix C and summarized below:

Budgetary		Annua	I Utility Savings		ROI	Potential	Payback (without	Payback (with
COSI	EI	ectricity	Natural Gas	Total		Incentive	incentive)	incentive)
\$	kW	kWh	Therms	\$		\$	Years	Years
717	0	0	259	279	4.8	0	2.6	2.6

ECM-3 Install pipe insulation

* Incentive shown, if available, is per the New Jersey SmartStart Program. See section 6.0 for other incentive opportunities.

This measure is recommended.

5.4.1 ECM-L1 Lighting Replacement / Upgrades

The building has a mixture of T-8 fluorescent, incandescent and CFL lighting fixtures. Exterior lights are various wattage metal halide fixtures. The majority of these lights are controlled by occupancy sensors, therefore there are minimal potential savings for improving lighting control.

Overall energy consumption can be reduced by replacing inefficient bulbs and linear fluorescent bulbs with more efficient LED technology. To compute the annual savings for this ECM, the energy consumption of the current lighting fixtures was established and compared to the proposed fixture power requirement with the same annual hours of operation. The difference between the existing and proposed annual energy consumption was the energy savings. These calculations are based on 1 to 1 replacements of the fixtures, and do not take into account lumen output requirements for a given space. A more comprehensive engineering study should be performed to determine correct lighting levels.

Supporting calculations, including assumptions for lighting hours and annual energy usage for each fixture, are provided in Appendix C and summarized below:

Budgetary Cost		Annual	Utility Savings		ROI	Potential	Payback (without	Payback (with incentive)	
	Ele	ectricity	Natural Gas	Total		Incentive	incentive)		
\$	kW	kWh	Therms	\$		\$	Years	Years	
22,089	4.9	18,235	0	3,029	1.1	1,478	7.3	6.8	

ECM-L1 Lighting Replacement / Upgrades

* LED retrofits must go through the "custom" measures incentive option under New Jersey SmartStart Program. There are no "prescriptive" incentives for LED retrofits. Projects must achieve a minimum of 75,000 kWh annual savings to qualify for "custom" incentives. See section 6.0 for other incentive opportunities

This measure is recommended.

5.5 Additional O&M Opportunities

This list of operations and maintenance (O&M) - type measures represent low-cost or nocost opportunities, which if implemented will have a positive impact on the overall building operations, comfort and/or energy consumption. The recommended O&M measures for this building are as follows:

- Replace door seals and sweeps.
- Purchase Energy Star labeled appliances when replacement is needed.
- Install an insulation blanket on the domestic hot water heater

6.0 PROJECT INCENTIVES

6.1 Incentives Overview

The following sections give detailed information on available incentive programs including New Jersey Smart Start, Direct Install, New Jersey Pay for Performance (P4P) and Energy Savings Improvement Plan (ESIP). If the city wishes to and is eligible to participate in the Energy Savings Improvement Plan (ESIP) program and/or the Pay for Performance Incentive Program (P4P), it cannot participate in either the Smart Start or Direct Install Programs. Refer to Appendix D for more information on the Smart Start program.

6.1.1 New Jersey Smart Start Program

For this energy audit, The New Jersey Smart Start Incentives are used in the energy savings calculations, where applicable. This program is intended for medium and large energy users and provides incentives for:

- Electric Chillers
- Gas Chillers
- Gas Heating
- Unitary HVAC
- Ground Source Heat Pumps
- Variable frequency Drives/ motors
- Refrigeration
- Prescriptive and performance lighting and lighting controls

The equipment is procured using a typical bid- build method, installed and paid for and then the incentives are reimbursed to the owner.

Forest Glen Elementary School qualifies for the direct install program since the peak electric demand in the evaluated 12 month period was below 200 KW.

Refer to Appendix D for more information on the Smart Start program.

6.1.2 Direct Install Program

The Direct Install Program applies to smaller facilities that have a peak electrical demand of 200 kW or less in any of the previous 12 months. Buildings must be located in New Jersey and served by one of the state's public, regulated electric utility companies.

Direct Install is funded through New Jersey's Clean Energy Program and is designed to provide capital for building energy upgrade projects to fast track implementation. The program will pay up to 70% of the costs for lighting, HVAC, motors, refrigeration, and other equipment upgrades with higher efficiency alternatives. If a building is eligible for this funding, the Direct Install Program can reduce the implementation cost of energy conservation projects.

The Direct Install program has specific HVAC equipment and lighting requirements and is generally applicable only to smaller package HVAC units, small boilers and lighting retrofits.

The program pays a maximum amount of \$75,000 per building, and up to \$250,000 per customer per year. Installations must be completed by an approved Direct Install participating contractor, a list of which can be found on the New Jersey Clean Energy Website. Contractors will coordinate with the applicant to arrange installation of recommended measures identified in a previous energy assessment, such as this energy audit. The incentive is reimbursed to the Owner upon successful replacement and payment of the equipment.

6.1.3 New Jersey Pay For Performance Program (P4P)

This building may be eligible for incentives from the New Jersey Office of Clean Energy. The most significant incentives are available from the New Jersey Pay for Performance (P4P) Program. The P4P program is designed to offset the cost of energy conservation projects for facilities that pay the Societal Benefits Charge (SBC) and whose demand (kW) in any of the preceding 12 months exceeds 100 kW. This demand minimum has been waived for buildings owned by local governments or municipalities and non-profit organizations and *is not applicable to public schools*. Facilities that meet this criterion must also achieve a minimum performance target of 15% energy reduction by using the EPA Portfolio Manager benchmarking tool before and after implementation of the measure(s). Additionally, the overall return on investment (ROI) must exceed 10%. If the participant is a municipal electric company customer, and a customer of a regulated gas New Jersey Utility, only gas measures will be eligible under the Program. Available incentives are as follows:

Incentive #1: Energy Reduction Plan – This incentive is designed to offset the cost of services associated with the development of the Energy Reduction Plan (ERP). The ERP must include a detailed energy audit of the desired ECMs, energy savings calculations (using building modeling software) and inputting of all utility bills into the EPA Portfolio Manager website.

- Incentive Amount: \$0.10/SF
- Minimum incentive: \$5,000
- Maximum Incentive: \$50,000 or 50% of Facility annual energy cost

The standard incentive pays \$0.10 per square foot, up to a maximum of \$50,000, not to exceed 50% of facility annual energy cost, paid after approval of application. For building audits funded by the New Jersey Board of Public Utilities, which receive an initial 75% incentive toward performance of the energy audit, facilities are only eligible for an additional \$0.05 per square foot, up to a maximum of \$25,000, rather than the standard incentive noted above. The ERP must be completed by a Certified Energy Manager (CEM) and submitted along with the project application.

Incentive #2: Installation of Recommended Measures – This incentive is based on projected energy savings as determined in Incentive #1 (Minimum 15% savings must be achieved), and is paid upon successful installation of recommended measures.

<u>Electric</u>

• Base incentive based on 15% savings: \$0.09/ per projected kWh saved.

- For each % over 15% add: \$0.005 per projected kWh saved.
- Maximum incentive: \$0.11/ kWh per projected kWh saved.

Gas

- Base incentive based on 15% savings: \$0.90/ per projected Therm saved.
- For each % over 15% add: \$0.05 per projected Therm saved.
- Maximum incentive: \$1.25 per projected Therm saved.

Incentive cap: 25% of total project cost

Incentive #3: Post-Construction Benchmarking Report – This incentive is paid after acceptance of a report proving energy savings over one year utilizing the Environmental Protection Agency (EPA) Portfolio Manager benchmarking tool.

<u>Electric</u>

- Base incentive based on 15% savings: \$0.09/ per projected kWh saved.
- For each % over 15% add: \$0.005 per projected kWh saved.
- Maximum incentive: \$0.11/ kWh per projected kWh saved.

Gas

- Base incentive based on 15% savings: \$0.90/ per projected Therm saved.
- For each % over 15% add: \$0.05 per projected Therm saved.
- Maximum incentive: \$1.25 per projected Therm saved.

Combining Incentives #2 and #3 will provide a total of \$0.18/ kWh and \$1.8/therm not to exceed 50% of total project cost. Additional Incentives for #2 and #3 are increased by \$0.005/kWh and \$0.05/therm for each percentage increase above the 15% minimum target to 20%, calculated with the EPA Portfolio Manager benchmarking tool, not to exceed 50% of total project cost.

For the purpose of demonstrating the eligibility of the ECM's to meet the minimum savings requirement of 15% annual savings and 10% ROI for the Pay for Performance Program, all ECM's identified in this report have been included in the incentive calculations. The results for the building are shown in Appendix C.

6.1.4 Energy Savings Improvement Plan

The Energy Savings Improvement Program (ESIP) allows government agencies to make energy related improvements to their facilities and pay for the costs using the value of energy savings that result from the improvements. Under the recently enacted Chapter 4 of the Laws of 2009 (the law), the ESIP provides all government agencies in New Jersey with a flexible tool to improve and reduce energy usage with minimal expenditure of new financial resources.

ESIP allows local units to use "energy savings obligations" (ESO) to pay for the capital costs of energy improvements to their facilities. ESIP loans have a maximum loan term of 15 year. ESOs are not considered "new general obligation debt" of a local unit and do not count against debt limits or require voter approval. They may be issued as refunding bonds or leases. Savings generated from the installation of energy conservation measures pay the principal of and interest on the bonds; for that reason, the debt service created by the ESOs is not paid from the debt service fund, but is paid from the general fund.

For local governments interested in pursuing an ESIP, the first step is to perform an energy audit. Pursuing a Local Government Energy Audit through New Jersey's Clean Energy Program is a valuable first step to the ESIP approach. The "Local Finance Notice" outlines how local governments can develop and implement an ESIP for their facilities. The ESIP can be prepared internally if the entity has qualified staff. If not, the ESIP must be implemented by an independent contractor and not by the energy savings company producing the Energy Reduction Plan.

The ESIP approach may not be appropriate for all energy conservation and energy efficiency improvements. Local units should carefully consider all alternatives to develop an approach that best meets their needs.

6.1.5 Renewable Energy Incentive Program

The Renewable Energy Incentive Program (REIP) is part of New Jersey's efforts to reach its Energy Master Plan goals of striving to use 30 percent of electricity from renewable sources by 2020.

Incentives for sustainable bio-power projects and for energy storage projects are currently under development, with competitive solicitations for each of those technologies expected to begin in the first quarter of 2014. The wind program is currently on hold.

New solar projects are no longer eligible for REIP incentives, but can register for Solar Renewable Energy Certificates (SRECs) through the SREC Registration Program (SRP).

7.0 ALTERNATIVE ENERGY SCREENING EVALUATION

7.1 Solar

7.1.1 Photovoltaic Rooftop Solar Power Generation

The building was evaluated for the potential to install rooftop photovoltaic (PV) solar panels for power generation. Present technology incorporates the use of solar cell arrays that produce direct current (DC) electricity. This DC current is converted to alternating current (AC) with the use of an electrical device known as an inverter. The amount of available roof area determines how large of a solar array can be installed on any given roof. Due to the fact that there is not a significant amount of free space on this roof and because there are several trees that shade it for a good portion of the day, installation of a solar PV system was not considered for this building.

Installation of (PV) arrays in the state New Jersey will allow the owner to participate in the New Jersey Solar Renewable Energy Certificates Program (SREC). This is a program that has been set up to allow entities with large amounts of environmentally unfriendly emissions to purchase credits from zero emission (PV) solar-producers. An alternative compliance penalty (ACP) is paid for by the high emission producers and is set each year on a declining scale of 3% per year. One SREC credit is equivalent to 1000 kilowatt hours of PV electrical production; these credits can be traded for period of 15 years from the date of installation. Payments that will be received by the PV producer will change from year to year dependent upon supply and demand. There is no definitive way to calculate an exact price that will be received by the PV producer for SREC credits over the next 15 years. Renewable Energy Consultants estimates an average of \$200/SREC for 2015 and this number was utilized in the cash flow for this report.

The system costs for PV installations were derived from recent solar contractor budgetary pricing in the state of New Jersey and include the total cost of the system installation (PV panels, inverters, wiring, ballast, controls). The cost of installation is currently about \$4.00 per watt or \$4,000 per kW of installed system, for a typical system. There are other considerations that have not been included in this pricing, such as the condition of the roof and need for structural reinforcement. Photovoltaic systems can be ground mounted if the roof is not suitable, however, this installation requires a substantial amount of open property (not wooded) and underground wiring, which adds more cost. PV panels have an approximate 20 year life span; however, the inverter device that converts DC electricity to AC has a life span of 10 to 12 years and will most likely need to be replaced during the useful life of the PV system.

7.1.2 Solar Thermal Hot Water Generation

Active solar thermal systems use solar collectors to gather the sun's energy to heat a fluid. An absorber in the collector (usually black colored piping) converts the sun's energy into heat. The heat is transferred to circulating water, antifreeze, or air for immediate use or is storage for later utilization. Applications for active solar thermal energy include supplementing domestic hot water, heating swimming pools, space heating or preheating air in residential and commercial buildings. A standard solar hot water system is typically composed of solar collectors, heat storage vessel, piping, circulators, and controls. Systems are typically integrated to work alongside a conventional heating system that provides heat when solar resources are not sufficient. The solar collectors are usually placed on the roof of the building, oriented south, and tilted at the same angle as the site's latitude, to maximize the amount of solar radiation collected on a yearly basis.

Several options exist for using active solar thermal systems for space heating. The most common method is called a passive solar hot water system involves using glazed collectors to heat a liquid held in a storage tank (similar to an active solar hot water system described above which requires pumping). The most practical system would transfer the heat from the panels to thermal storage tanks and then use the pre-heated water for domestic hot water production. DHW is presently produced by natural gas fired water heaters and, therefore, this measure would offer natural gas utility savings. Unfortunately, the amount of domestic hot water system is not recommended due to the limited amount of domestic hot water presently consumed by the building.

This measure is not recommended due to the relatively low domestic hot water usage.

7.2 Wind Powered Turbines

Wind power is the conversion of kinetic energy from wind into mechanical power that is used to drive a generator which creates electricity by means of a wind turbine. A wind turbine consists of rotor and blades connected to a gearbox and generator that are mounted onto a tower. Newer wind turbines also use advanced technology to generate electricity at a variety of frequencies depending on the wind speed, convert it to DC and then back to AC before sending it to the grid. Wind turbines range from 50 – 750 kW for utility scale turbines down to below 50 kW for residential use. On a scale of 1 (the lowest) to 7 (the highest), Class 3 and above (wind speeds of 13 mph or greater) are generally considered "good wind resource" according to the Wind Energy Development Programmatic EIS Information Center hosted by the Bureau of Land Management. According to the map below, published by NREL, Glen Rock, NJ is classified as Class 1 at 50m, meaning the city would not be a good candidate for wind power.

This measure is not recommended due to the location of the building.

7.3 Combined Heat and Power Plant

Combined heat and power (CHP), cogeneration, is self-production of electricity on-site with beneficial recovery of the heat byproduct from the electrical generator. Common CHP equipment includes reciprocating engine-driven, micro turbines, steam turbines, and fuel cells. Typical CHP customers include industrial, commercial, institutional, educational institutions, and multifamily residential facilities. CHP systems that are commercially viable at the present time are sized approximately 50 kW and above, with numerous options in blocks grouped around 300 kW, 800 kW, 1,200 kW and larger. Typically, CHP systems are used to produce a portion of the electricity needed by a facility some or all of the time, with the balance of electric needs satisfied by purchase from the grid.

Any proposed CHP project will need to consider many factors, such as existing system load, use of thermal energy produced, system size, natural gas fuel availability, and proposed plant location. The building has sufficient need for electrical generation and the ability to use most of the thermal byproduct during the winter; however thermal usage during the summer months does not exist. Thermal energy produced by the CHP plant in the warmer months will be wasted. An absorption chiller could be installed to utilize the heat to produce chilled water; however, there is no chilled water distribution system in the building. CHP is not recommended due to the building's limited summer thermal demand.

This measure is not recommended due to the absence of large enough year-round thermal loads which are needed for efficiency CHP operation.

7.4 Demand Response Curtailment

Presently, electricity is delivered by PSE&G, which receives the electricity from regional power grid RFC. PSE&G is the regional transmission organization (RTO) that coordinates the movement of wholesale electricity in all or parts of 13 states and the District of Columbia including the State of New Jersey.

Utility Curtailment is an agreement with the utility provider's regional transmission organization and an approved Curtailment Service Provider (CSP) to shed electrical load by either turning major equipment off or energizing all or part of a facility utilizing an emergency generator; therefore, reducing the electrical demand on the utility grid. This program is to benefit the utility company during high demand periods and utility provider offers incentives to the CSP to participate in this program. Enrolling in the program will require program participants to drop electrical load or turn on emergency generators during high electrical demand conditions or during emergencies. Part of the program also will require that program participants reduce their required load or run emergency generators with notice to test the system.

A pre-approved CSP will require a minimum of 100 kW of load reduction to participate in any curtailment program. From January 2014 through December 2014 the following table summarizes the electricity load profile for the building.

Building Electric Load Profile

Peak Demand kW	Min Demand kW	Avg Demand kW	Onsite Generation Y/N	Eligible? Y/N
30.4	12.0	19.8	N	N

*the demand is estimated from one month bill

This measure is not recommended due to the low demand usage.

8.0 CONCLUSIONS & RECOMMENDATIONS

The following section summarizes the LGEA energy audit conducted by CHA for the Borough of Glen Rock fire Department.

The following projects should be considered for implementation:

- Replace DHW heater with Condensing DHW heater
- Install pipe insulation
- Lighting Replacements

The potential annual energy and cost savings for the recommended ECMs are shown in the following table.

Electric Savings (kWh)	Natural Gas Savings (therms)	Total Savings (\$)	Payback (years)
18,235	546	3,619	8.2

If the Borough of Glen Rock implements the recommended ECMs, energy savings would be as follows:

	Existing Conditions	Post Recommended ECMs	Percent Savings
Costs (\$)	18,647	14,461	22%
Electricity (kWh)	69,040	50,805	26%
Natural Gas (therms)	6,295	5,749	9%
Greenhouse Gas Reduction (MT CO2)	63	52	17%
Site EUI (kbtu/SF/Yr)	90.1	77.9	

Next Steps: This energy audit has identified several areas of potential energy savings. Borough of Glen Rock can use this information to pursue incentives offered by the NJBPU's NJ Clean Energy Program. A close out meeting will be scheduled with Borough of Glenrock staff members to review the ECMs and possible incentive options. APPENDIX A

ECM-2: Replace Gas-Fired DHW Heater w/ Tank Condensing Gas-Fired DHW Heater

Description: This ECM evaluates the energy savings associated with replacing a gas fired tank type water heater with an equivalent capacity tank condensing water heater.

Item	Value	Units	Formula/Comments
Avg. Monthly Utility Demand by Water Heater	150	Therms/month	Calculated from utility bill
Total Annual Utility Demand by Water Heater	180.000	MBTU/vr	1therm = 100 MBTU
Existing DHW Heater Efficiency	80%		Per manufacturer nameplate
Total Annual Hot Water Demand (w/ standby losses)	144,000	MBTU/yr	
		-	
Existing Tank Size	40	Gallons	Per manufacturer nameplate
Hot Water Piping System Capacity	5	Gallons	Estimated Per existing system (includes HWR piping)
Hot Water Temperature	140	°F	Per building personnel
Room Temperature	72	°F	
Standby Losses (% by Volume)	2.5%		(2.5% of stored capacity per hour, per U.S. Department of Energy)
Standby Losses (Heat Loss)	0.6	MBH	
Annual Standby Hot Water Load	5,585	MBTU/yr	
		-	
New Tank Size	50	Gallons	Based on Takagi Flash T-H1 instantaneous, condensing DHW Heater
Hot Water Piping System Capacity	5	Gallons	Estimated Per existing system (includes HWR piping)
Hot Water Temperature	140	°F	
Room Temperature	72	°F	
Standby Losses (% by Volume)	2.5%		(2.5% of stored capacity per hour, per U.S. Department of Energy)
Standby Losses (Heat Loss)	0.8	MBH	
Annual Standby Hot Water Load	6,826	MBTU/yr	
Total Annual Hot Water Demand	145,241	MBTU/yr	
		-	
Proposed Avg. Hot water heater efficiency	96%		Based on Takagi Flash T-H1 instantaneous, condensing DHW Heater
Proposed Fuel Use	1,513	Therns	Standby Losses and inefficient DHW heater eliminated
Utility Cost	\$1.08	\$/Therm	
Existing Operating Cost of DHW	\$1,943	\$/yr	
Proposed Operating Cost of DHW	\$1,633	\$/yr	

Savings Summary:

Utility	Energy Savings	Cost Savings
Therms/yr	287	\$310

Formula

Piping Correction Factor = (Current Transmission Coefficient / Reference Transmission Coefficient) Temperature Correction Factor = (Circulating Temperature - Ambient Temperature) / (Circulating Temperature - Reference Temperature) Hourly Heat Loss per pipe size and length = (Heat loss per foot [from chart]) x (Piping Correction Factor) x (Temperature Correction Factor) x (Pipe Length) Seasonal Heat Loss = (Hourly Heat Loss Total) x (Operating hours) / (Heating Efficiency) / (1,000 btu/Mbtu)

Energy Loss = (Seasonal Heat Loss) / (Conversion Factor [MBtu/Unit]) Energy Loss Cost = (Energy Loss) x (cost/unit)

New Jersey Pay For Performance Incentive Program

Note: The following calculation is based on the New Jersey Pay For Performance Incentive Program per April, 2012. Building must have a minimum average electric demand of 100 kW. This minimum is waived for buildings owned by local governements or non-profit organizations.

Values used in this calculation are for ALL identified measures except for alternate ECMs, regardless of payback or IRR. P4P estimated incentives represent a best case scenario, and will likely be lower depending on which measures are included. The savings displayed here are not guaranteed to qualify for P4P incentives if IRR or payback requirements are not met.

EPA Benchmarking Report

ENERGY STAR[®] Statement of Energy

Performance

Fire Department

Primary Property Function: Fire Station Gross Floor Area (ft2): 9,604 Built: 1929

ENERGY STAR® Score¹

For Year Ending: December 31, 2014 Date Generated: October 29, 2015

1. The ENERGY STAR score is a 1-100 assessment of a building's energy efficiency as compared with similar buildings nationwide, adjusting for climate and business activity.

Property	& Contac	ct Information
